

## A3 DATABASES · A3.3

# Database programming with SQL

Talking to a database: the **SQL** language families, **queries** and **INNER JOIN**, changing data, **aggregate** functions, views, and **ACID** (worked queries on page 3).

## 01 SQL sublanguages

|            |  |
|------------|--|
| <b>DDL</b> | CREATE, ALTER, DROP — structure.       |
| <b>DML</b> | SELECT, INSERT, UPDATE, DELETE — data. |
| <b>DCL</b> | GRANT, REVOKE — access.                |
| <b>TCL</b> | COMMIT, ROLLBACK — transactions.       |

## 02 Query clauses

|                       |                                 |
|-----------------------|---------------------------------|
| <b>SELECT</b>         | Which columns to return.        |
| <b>FROM</b>           | The main table.                 |
| <b>INNER JOIN ...</b> |                                 |
| <b>ON</b>             | Combine tables on a shared key. |
| <b>WHERE</b>          | Filter rows by a condition.     |
| <b>ORDER</b>          |                                 |
| <b>BY</b>             | Sort the results.               |
| <b>GROUP</b>          |                                 |
| <b>BY</b>             | Group rows for aggregates.      |

## 03 Changing data · always with a WHERE

+

### INSERT

Add a new record. INSERT INTO Student (StudentID, StudentName) VALUES ('S5','Eve');

~

### UPDATE

Change records. UPDATE Student SET MentorID='M3' WHERE StudentID='S4';

-

### DELETE

Remove records. DELETE FROM Student WHERE StudentID='S4';

**04 Aggregate functions**

|                      |                           |
|----------------------|---------------------------|
| <b>COUNT</b>         | How many rows.            |
| <b>SUM</b>           | Total of a column.        |
| <b>AVG</b>           | Average of a column.      |
| <b>MIN /<br/>MAX</b> | Smallest / largest value. |
| <b>GROUP<br/>BY</b>  | One result per category.  |

**05 Views**

|                 |                                      |
|-----------------|--------------------------------------|
| <b>View</b>     | A virtual table: a saved query.      |
| <b>No data</b>  | Shows a live result, stores nothing. |
| <b>Simplify</b> | Wrap a complex JOIN in one name.     |
| <b>Security</b> | Expose only certain columns/rows.    |

**06 ACID · how transactions protect data**

|                    |   |          |
|--------------------|---|----------|
| <b>Atomicity</b>   | All the operations in the transaction succeed, or none do (no half-finished changes). | <b>A</b> |
| <b>Consistency</b> | The database moves from one valid state to another, never breaking its rules.         | <b>C</b> |
| <b>Isolation</b>   | Concurrent transactions do not interfere with each other.                             | <b>I</b> |
| <b>Durability</b>  | Once committed, the changes survive even a power loss or crash.                       | <b>D</b> |

## 07 SQL in action · queries and INNER JOIN

Sample data · two tables linked by MentorID

Student

| StudentID | StudentName | MentorID |
|-----------|-------------|----------|
| S1        | Aisha       | M2       |
| S2        | Ben         | M1       |
| S3        | Chloe       | M2       |
| S4        | Dan         | M9       |

Mentor

| MentorID | MentorName |
|----------|------------|
| M1       | Mr Ng      |
| M2       | Ms Patel   |
| M3       | Dr Owusu   |

Basic query · students mentored by M2, sorted by name

```
SELECT StudentName
FROM Student
WHERE MentorID = 'M2'
ORDER BY StudentName;
```

Result

| StudentName |
|-------------|
| Aisha       |
| Chloe       |

INNER JOIN · pair each student with their mentor's name

```
SELECT Student.StudentName,
       Mentor.MentorName
FROM Student
INNER JOIN Mentor
ON Student.MentorID = Mentor.MentorID;
```

Result (only matching rows)

| StudentName | MentorName |
|-------------|------------|
| Aisha       | Ms Patel   |
| Ben         | Mr Ng      |
| Chloe       | Ms Patel   |

**Why no Dan or Dr Owusu?** INNER JOIN keeps a row only when the key matches in **both** tables. Dan's mentor M9 does not exist, and mentor M3 has no students, so both are dropped.

## FINAL PASS BEFORE THE EXAM

## Rapid exam tips

Eight things that lose marks in Paper 1 if you slip on them. Skim before you walk in.

**01**

**DDL** defines structure (CREATE/ALTER/DROP); **DML** changes data (SELECT/INSERT/UPDATE/DELETE).

**02**

**DELETE** removes rows; **DROP** removes the whole table.

**03**

Always add a **WHERE** to UPDATE or DELETE, or you change every row.

**04**

An **INNER JOIN** matches a foreign key to a primary key with **ON**, and keeps only rows that match in **both** tables.

**05**

Aggregates (**COUNT, SUM, AVG, MIN, MAX**) need **GROUP BY** for per-category results.

**06**

A **view** is a virtual table (a saved query), not stored data.

**07**

A **transaction** is all-or-nothing. Know **ACID**: atomicity, consistency, isolation, durability.

**08**

When asked to classify a command, name its family: **DDL, DML, DCL, or TCL**.
